

Governance as Infrastructure v1

Normative Requirements (v1.0)

- Governance must be machine-compatible or it will be bypassed.
- Governance includes intent encoding, observability, intervention, and learning.
- Governance replaces committee-based oversight with operational controls.
- Governance scales with autonomy.
- Well-designed governance increases speed while preserving control.

Interpretive Guidance (Non-Normative)

Autonomous systems operate continuously and require governance at machine speed.

Committees cannot supervise autonomous execution.

Governance must be embedded into systems, not layered on top.

Effective governance accelerates responsible autonomy.
